5. Answer the following items (5 items x 10 points):

- If you were asked to connect an application layer to the design above, on what specific business element would you connect it? Why? **The Claim Handling Business Service into Handle Claim Business Process defined the behavior of each other specify the services provided by the business.**
- If you were asked to connect a technology layer to the design above, on what specific business element would you connect it? Why? **Technology Interface to System Software support the business environment and its functionality utilizing application including the data deployed within the environment.**
- If you were asked to design the application layer of an insurance company, what particular data objects would you specify? Give at least one (1) and rationalize your answer. **The PolicyHolder is the central user entity in any insurance application. This object represents the individual or organization that owns one or more insurance policies. Almost every function in an insurance system from policy issuance to claims processing revolves around this entity.**
- Give one (1) possible advantage of separately designing each enterprise architecture layer.
Rationalize your answer. **One advantage of separately designing each enterprise architecture layer is clarity and focus. For example, by separating the business layer from the application and technology layers, BrokeBoys Clothing Brand can first focus on what processes need to be done before deciding how technology will support them. This reduces complexity and avoids designing systems that don't match actual business needs.**

• In your opinion, what is the importance of knowing the appropriate elements in designing an

enterprise architecture layer? **Knowing the appropriate elements in designing an enterprise architecture layer is important because it ensures the system is aligned with business goals, efficient, and secure. It helps avoid unnecessary complexity, supports smooth integration between layers, improves decision-making, and ensures compliance with standards. Overall, it leads to a more effective and scalable architecture.**
